- **III.** Future Directions of Dairy Policy
- IV. Vision of Korea Dairy Industry

I. Overview of Korean Dairy Industry

1. Characteristics of Korean Dairy Industry

History

Started with a commercial dairy in the 1930s, modernized in 1960 & contemporary dairy industry since 1990

Spread Of Farm

Approximately 6,000 farms located mainly suburban area of metropolitans

Management Heavily depending on imported feedstuffs because of limited pasture Mainly intensive farming system with family-own labor

Self-Sufficiency Rate

Production of 2.1 million tons of milk annually, which covers 62% of total consumption

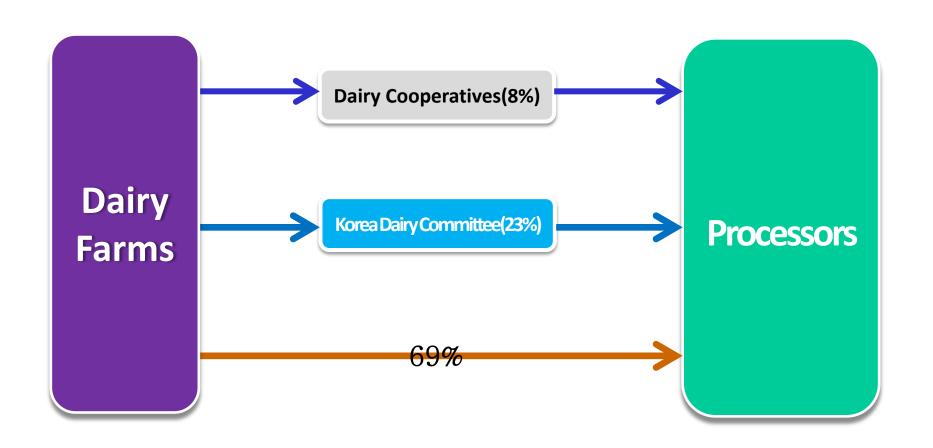

Competitive -ness

Raw milk price is 2 or 3 times higher than other countries

2. Supply System of Raw Milk

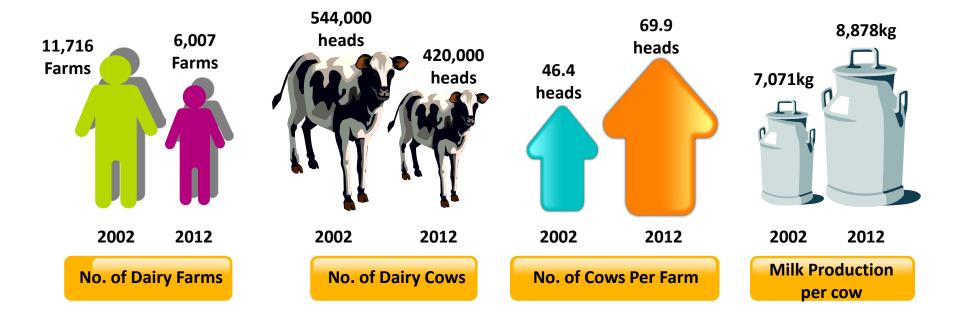

3. Raw Milk Production

Milk Production

- ◆ Total Value of Production: 1.8 Billion USD in `12
 - App. 12.6% of total value of livestock production
- ♦ Milk Production : ['02] 2.54 Million tons \rightarrow ('05) 2.23 \rightarrow ('11) 1.89 \rightarrow ('12) 2.11

4. Milk Processing

Total Value of Production of Dairy Product

6.4 billion USD in 2011, 26.8% increase compared to 5.5 billion USD in 2005

- No. of processing factories decreased due to decreases in the consumption and the market structure based on the domestic demand : ['00] 55 → ['12] 44

Use of domestic raw milk in 2012 (Total amount 2,110,000 ton)

Fluid Milk

1,410,000t (66.6%)

Powdered Milk

200,000t (9.3%)

Processed Milk

170,000t (8.1%)

Others

330,000t (16.0%)

Market Structure: 3 processors (Seoul, Namyang, Maeil) share 61% of the market

Annual consumption of dairy product per capita[67.2kg] is similar to that of rice [69.8kg].

Processing Capacity of Processors is 9,919 ton /day.

- Fluid Milk 7,447, Fermented milk 2,072, Cheese 97, Infant formula 140, Powdered milk 163

5. Milk Consumption

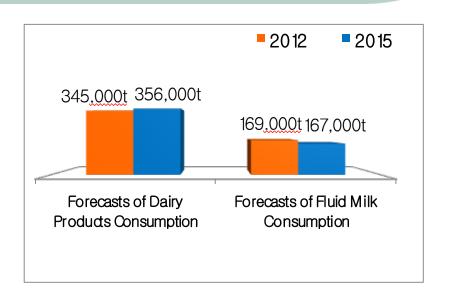

Such factors as decreased birth rate, lifestyle changes caused a decrease in consumption of fluid milk Increased consumption of other dairy products has lead to the total amount of consumption on the rise.

82.9% 2002 2012 62.8 64.3kg 67.2 34.9kg 33.6

Milk Self-Sufficiency Rate Fluid Milk
Consumption per
capita(kg)

Dairy Products
Consumption per
capita (kg)

II. Current Issues of Dairy Industry

Current Issues of Korea Dairy Industry

Necessity of supply control at the national level due to diversified raw milk production management authorities

Decreasing number of dairy farmers due to an aged population

Increased burden of farm management due to unstable international feed price, globally opening market, etc

Negative perception of livestock industry due to problems like livestock manure, animal diseases, etc

Decline in fluid milk consumption due to low birth rate and the expanding market of substitute drinks

III. Future Directions of Dairy Policy

Supply and Demand Control System On the national level

Necessity

> To maintain the equity among farmers and establish a stable supply and demand

control system of raw milk by managing production and distribution

Proposed Plan

- ➤ [Supply and demand control consultation] Stable supply and demand management, creation of measures at each stage
 - ✓ Supply and demand forecasting, establishment of standard regulation and self-regulating basis for co-prosperity
- ➤ [Supply and Demand Forecasting Models] Establishment of forecasting system for production and consumption of milk and dairy product using database
- No. of dairy cows, milk production per cow, raw milk production, consumption, use of raw milk, etc

Improvement of Productivity

A. Promotion of New Farmers and Successors

- To provide new farmers and successors with free lease of milk delivery license by each milk collection agent
- Free lease of milk delivery license at a maximum quantity of 1,000 per farm (recollecting in 7 years with a 3-year of grace period)

B. Operation of Farms Raising Heifers

To reduce the production cost and expand the production life span of cows by operating farms specialized for raising replacement heifers for outsourcing

Improvement of Productivity

C. Reduction & Stabilization of Feed Cost

- (Price Stabilization) Stabilization of feed price and promotion of livestock product competitiveness through the promotion of overseas agricultural development
 - Reducing grain feed ration through revolutionizing the grading system of livestock products and decreasing the age at slaughter
 - Promoting overseas agricultural development including expansion of secured grain from overseas development projects
- (Increasing Forage Production) Establishment of forage production system to enhance the quality of livestock products
 - Use of idle farmland and reclaimed land to increase the production of high quality forage and improving conditions for support the forage business to encourage participation in producing forage
 - Constructing a quality evaluation system of forage, enhancing consulting service targeting the management and education/promotion for farmers

Enhancement of Competitiveness

A. Establishment of Eco-friendly Livestock Foundation

- Promotion of livestock farming in mountainous areas by using idle mountains such as national forest
 - Verification of applicability to common farms after implementing a pilot project (after '14)
- Establishment of Eco-friendly Livestock Complex : Pilot project till '15(5 complexes)

B. Promotion of Nutrient Recycling of Livestock Manure

- Joint nutrient recycling system of livestock manure and expansion of facilities
 - * Joint resource recovery/energy recovery facility : ('12) 85/6 \rightarrow ('13) 98/8 \rightarrow ('17) 150/21
- Compulsory registration of fertilizer production, standard setting on diffusion of liquid fertilizer and compulsory prescription of fertilization to produce high quality manure and liquid fertilizer
- Promotion of consultants and establishment of private organizations for an efficient management of livestock manure

Enhancement of Competitiveness

C. Eradication of Livestock Diseases

- To acquire the status of a Foot-and-Mouth Disease free nation in '14
 - Advanced preventive measures to better control risk factors
 by nationwide sterilization and forecasting, special control over
 livestock-related officials visiting countries with the outbreak of FMD,
 and enhancing management of vaccination of foot-and-mouth disease
- To test-operate a disease control rating system by each farm('13) and devise and distribute a manual regarding prevention and quarantine by each livestock species and facility('13-'14) as well as progressive implementation of livestock license system

Expansion of Consumption

Necessity

- ➤ To solve difficulty in maintaining the dairy industry due to decreasing self-sufficiency rate caused by increasing imports.
- To secure stable milk consumption and ease difficulty such as spread of Anti Milk campaign, low birth rates, etc
- > To address expansion of indifference due to the misunderstanding of milk and the lack of awareness for school milk

Proposed Plan

- (Expansion of Consumption) Promoting consumption of fresh milk by generic market funded by dairy producers
- (Promoting R&D) Securing quality competitiveness by developing new and diverse products
- (Prospective consumers) Promoting a good habit of drinking milk by expanding school milk program

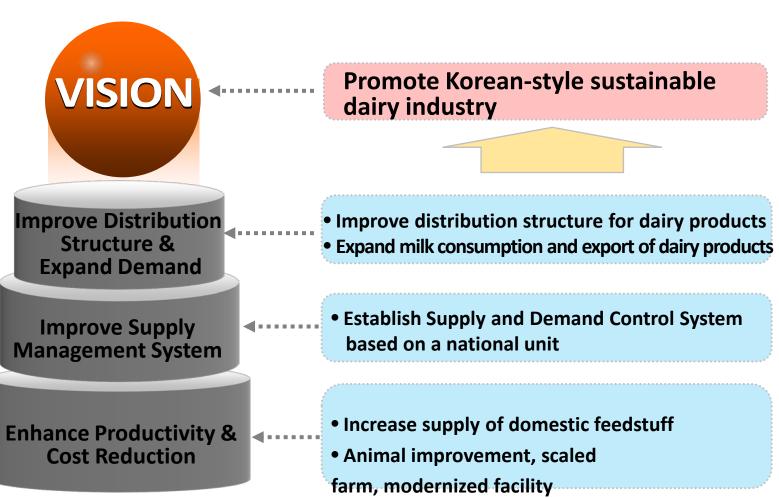

IV. Vision of Korean Dairy Industry

1. Vision of Korean Dairy Industry

2. Future of Dairy Industry

1. Managing Supply and Demand

Past

(2002)

Production

2,537,000t

Surplus Milk

505,000t

(Policy Measure)

- Implementation of voluntary production contracts by collection agents
- Support of processed raw milk for farms affiliated with Korea Dairy Committee (KDC)
- Voluntary reduction in milk production leaded by KDC

Present (2012)

Production

2,111,000t

Surplus Milk

1,000t

(Policy Measures)

- Establishment of Supply and Demand Control System at the national level
- Support of processed raw milk
- Establishment of dairy supply and demand control consultative body by private-self regulations
- Operation of a quota bank

Future (2020)

Production

2,180,000t

Surplus Milk

200,000t

2. Future of Dairy Industry

2. Expanding milk consumption

Past (2002)

Dairy Product Export

\$2.0million

School Milk Program

50.3%

Consumption per capita

64.3kg

(Policy Measures)

- Expanding consumption promotion campaign funded by dairy producers
- Expanding School Milk Program

Present (2012)

Dairy Product Export

\$1.42million

School Milk Program

52.3%

Consumption per capita

67.2kg

(Policy Measure)

- Expanding free school milk for lowincome children
- Expanding hands-on farm experience programs
- Supporting farmstead milk processing
- Discovering promising products for export
- Developing new functional dairy products

Future

(2020)

Dairy Product Export

\$3.75million

School Milk Program

54.7%

Consumption per capita

75.7kg

2. Future of Dairy Industry

3. Growth of Production

Past (2002)

No. of cows Per farm

46 heads

Milk production
Per cow

7,071kg

Average parities of dairy cows

2.4

(Policy Measures)

- Expanding cow breeding and testing
- Improvement of feeding management
- Improvement of farm gate milk price system

Present (2012)

No. of cows Per farm

70 heads

Milk production Per cow('10)

8,878kg

Average parities of dairy cows

2.5

(Policy Measure)

- Improving the dairy cow breeding program
- Building forage production infrastructure
- Modernizing and up-scaling dairy farm
- Improvement of raw milk price calculation system

Future (2017)

No. of cows Per farm

86 heads

Milk production Per cow

9,786kg

Average parities of dairy cows

2.7

Thank You
